The following table shows the results of the regression analysis for the dependent variable "Customer Satisfaction" (Y) and the independent variables "Service Quality" (X1), "Price" (X2), and "Brand Reputation" (X3). The model is represented by the equation: $Y = a + b_1X_1 + b_2X_2 + b_3X_3$.

Variable	Regression Coefficient (b)	t-value	p-value
Intercept (a)	1.2	1.5	0.15
Service Quality (X1)	0.8	2.1	0.04
Price (X2)	-0.3	-1.8	0.08
Brand Reputation (X3)	0.5	1.2	0.25

The adjusted R-squared value is 0.75, indicating that 75% of the variance in Customer Satisfaction is explained by the model. The F-statistic is 12.34, and the p-value for the overall model is 0.001, suggesting a statistically significant relationship between the independent variables and Customer Satisfaction.

THAT WAS
AN ACT.

ARE
YOU AN

AH,
THERE'S
ONE MORE
THING I WANT
TO SAY.

I NEVER
THOUGHT OF
YOU AS A

# Things that no one cares about.

In this work, there is one animal in each person's name, but I am really bad at deciding names, so there were actually 2~3 times just that I had to rethink names. Once I think of an animal, I can make up the rest, but it takes me a lot of time....

And I can't use the readers' name without permission. Hmmm.

Well, this is how it is, so in the future when I write stories/mangas, I might put in one animal name. (Well, even with the animal names, I would have rework on it 2-3 times.)
